

`ff` is a mighty operator, function and a cloud data source all at once!

As an operator or function it is used with no arguments and it creates the Free Form Programming Language's (ff) default blockchain which is currently set to Bloxberg 2.0.

In the ff script below you can see on the first line `ff` acts as singleton operator or function and `,` and on the 3rd line as a cloud data source:

```
ff  
  
show ff  
  
save as blox;
```

Output

"ff" → {"type" → "\"elliptic\"", "curve" → "\"ethereum\"", "compressed" → "False"}

```
ff  
  
tmp = "ffcurve";  
  
show tmp;  
  
save as blox;
```

Output

"tmp" → ethereum
